

AWS Announces General Availability of Bedrock AgentCore

Reuters - July 22, 2026

SEATTLE - Amazon Web Services (AWS) today announced the general availability of Amazon Bedrock AgentCore, a fully managed service that enables enterprises to deploy, scale, and govern AI agents in production environments.

The service provides built-in reliability, security, and observability features including:

- AgentCore Runtime for serverless agent deployment
- AgentCore Gateway for secure tool routing with policy enforcement
- Integration with Amazon Bedrock Guardrails for content safety
- Native support for the Model Context Protocol (MCP)

"Enterprises need a platform that handles the undifferentiated heavy lifting of running agents at scale," said Matt Garman, CEO of AWS. "AgentCore lets builders focus on agent logic while we handle deployment, scaling, security, and governance."

The announcement comes as the enterprise AI agent market continues to grow rapidly. According to Gartner, 75% of large enterprises will have deployed at least one AI agent in production by 2027, up from less than 5% in 2024.

AWS also announced that AgentCore now supports Bedrock Guardrails in the Policy layer, enabling enterprises to enforce content filtering, PII detection, and prompt attack prevention at the gateway level - outside the agent's code where it cannot be circumvented.

AgentCore is available in US East (N. Virginia), US West (Oregon), and Europe (Ireland) regions. Pricing is based on compute usage with no minimum commitments.
